

Fucci (Fluorescent Ubiquitination-based Cell Cycle Indicator) series

pFucci-G₁ Orange (Expression vector)

Code No.	Quantity
AM-V9003M	20 µg

VECTOR DESCRIPTION:

AM-V9003M pFucci-G₁ Orange is a mammalian expression vector encoding *CoralHue*® monomeric Kusabira-Orange 2 (mKO2) fused to a part of human Cdt1 (hCdt1: Cdc10 dependent transcript 1). “Fucci” stands for Fluorescent Ubiquitination-based Cell Cycle Indicator.

Cdt1 is the DNA replication licensing factor. It accumulates during G₁ phase in nuclei, but is degraded during S/G₂/M phases by ubiquitin-mediated proteolysis. A part of hCdt1 (30-120) is also degradable in a cell cycle dependent manner.

CoralHue® mKO2 has been generated from dimeric *CoralHue*® Kusabira-Orange (KO). *CoralHue*® mKO2 has a feature of rapid maturation.

SOURCE: The *CoralHue*® KO gene was cloned from a stony coral (*Fungia concinna*).

FORMULATION: Dry form. Reconstitute with distilled water or TE before use.

PURITY: A260/A280 > 1.5

STORAGE: Stored at -20°C

SEQUENCE LANDMARKS:

Fucci-G₁ Orange: bases 64-1041
CMV promoter: bases 4394-4956
SV40 polyA: bases 1204-1338
Kanamycin/Neomycin resistance gene: bases 2281-3072
pUC origin: bases 3663-4303
f1 origin: bases 1301-1756
SV40 origin: bases 2097-2232

INTENDED USE:

For Research Use Only. Not for use in diagnostic procedures.

GenBank:

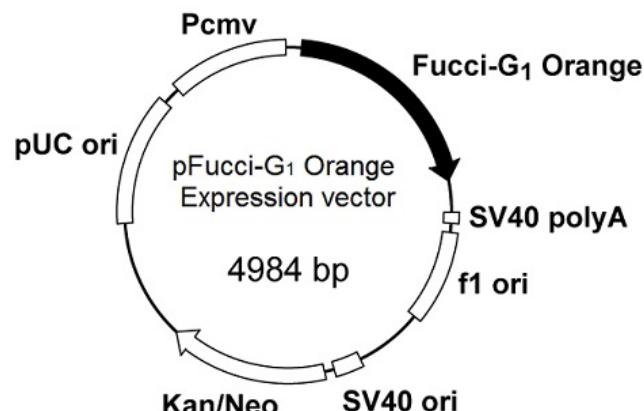

Accession Numbers: AB370332

NOTICES:

- 1) Val (encoded by GTG) is inserted as the second amino acid of *CoralHue*® mKO2 to form the Kozak sequence.
- 2) It is recommended that Fucci be stably expressed.
- 3) This vector contains the neomycin resistance gene to allow selection of stable transformants using G418. To successfully generate a stable cell line, you need to determine the minimum concentration of G418 required to kill your untransfected host cells.
